AI Automation Plan for a Water Solutions Company

Automation page

A practical way to turn QR scans, event conversations, and web inquiries into scored leads, useful dashboards, and faster staff follow-up.

What I would improve first

Most water companies do not need a giant AI rebuild. They need cleaner intake, better lead prioritization, faster follow-up, and simple reporting. I would connect those pieces into one practical workflow.

My role

I am freelancing now after Johnson & Johnson because I want to build systems directly for businesses. I can help more than basic sales: I can build the tool, train the team, and improve the process.

THE AUTOMATION SYSTEM

1. QR Intake

Customers scan a QR code at events, home shows, trucks, mailers, or ads. The form captures name, phone, email, zip, homeowner status, water type, common issues, urgency, and consent.

2. Lead Scoring

AI-assisted rules score each person by fit and urgency. Well water, stains, odor, white buildup, appliance issues, and this-week urgency push stronger leads to the top.

3. Staff Dashboard

Managers see hot/warm/cold leads, issue trends, search, filtering, and CSV export. Staff get a suggested follow-up script based on the homeowner's concern.

PROOF EXAMPLE: WATER SOLUTIONS EVENT AI

Built prototype: A working lead-capture and admin system for water solutions events.

Customer side: Homeowner quiz with issues like bad taste, chlorine smell, rotten egg smell, cloudy water, white buildup, orange/brown stains, dry skin or hair, appliance buildup, bottled-water use, and well-water concerns.

Business side: Lead score, hot/warm/cold temperature, recommendation text, admin dashboard, issue chart, search, filters, and CSV export.

WHY IT MATTERS

- Hot leads stop getting buried in notebooks, loose forms, or slow spreadsheets.

- Sales staff know what to say based on the customer's actual water complaint.

- Managers can see which issues are most common by event, campaign, or zip code.

- The company gets a repeatable system it can use at every event or local campaign.

FIRST 30 DAYS

Week 1 - Audit Review current forms, follow-up timing, appointment process, staff scripts, and where leads get lost.	Week 2 - Build Customize the QR quiz, scoring, dashboard fields, and water-specific recommendations.	Week 3 - Train Show staff how to use the dashboard, export leads, and follow up with recommended scripts.	Week 4 - Optimize Review results, tune scoring, add scripts, and create a simple monthly performance report.
--	--	---	--

POSSIBLE NEXT AUTOMATIONS

- Missed-call text follow-up for water test requests.	- AI-generated appointment reminder messages.	- Zip-code issue heat map for local campaign planning.
- Monthly summary of lead volume, hot-lead rate, and common complaints.	- Training scripts based on real customer objections.	- Website chatbot that routes homeowners to the right offer.
